Capstone project documentation

1. React application:

It is a web application built using React, which is a JavaScript library for building user interfaces. Developed and maintained by Facebook, React allows developers to create large web applications that can update and render efficiently in response to data changes.

React applications are known for their performance, modularity, and ease of maintenance.

They are widely used for developing modern web applications, including social media platforms, e-commerce sites, dashboards, and more.

2. Node.js :

1. Node.js is a JavaScript-based platform for server-side and networking applications.

2. It is a runtime environment that allows developers to run JavaScript code on the server side.

3. Node.js is commonly used for building web servers, real-time applications (like chat applications), APIs, and microservices, among other types of applications.

4. Node.js is a software platform for scalable server-side and networking applications.

5. Node.js applications are designed to maximize throughput and efficiency.

6. Node.js internally uses the Google V8 JavaScript engine to execute code.

Developer gives

1. .json file →it denotes write docker file for node.js
2. .txt file → it denotes write docker file for python
3. .jar file → it denotes write docker file for java
4. .xml file → it denotes write docker file for java.

→ But developer does not give .jar file. We can create .jar file using build tool [maven /gradel]

1. Maven [pom.xml]
2. Gradel [build.gradle]

File format	Docker file	Package management tool
package. json	Node.js	Npm [Node Package Manager]
requirement.txt	python	pip
app.jar pom.xml	java	Maven [pom.xml] Gradel [build.gradle]

Suppose package.json file [default file name] not given in github repo, it means it's an already build application. For run that application, we need web server [nginx or Apache]

difference between docker file and docker compose file

	Docker file	Docker compose file
purpose	Defines how to build a single Docker image.	Defines how to run multi-container applications.it is used for running multiple containers.
File type	Text file	.yaml / yml file
syntax	FROM, RUN, COPY, etc	YAML syntax to define services, networks, and volumes.
Content	It Contains instructions to set up an environment inside a container	It contains service definitions and configurations for running containers

By understanding these differences, you can effectively use both Docker file and Docker Compose together to build and deploy complex Docker-based applications.

Installing the necessary software's & services for this task:

1. **Git**
2. **Docker**
3. **Docker compose**
4. **Java**
5. **Jenkins**

Before install git. we have to launch an instance. select ubuntu

Launch an instance Info

Amazon EC2 allows you to create virtual machines, or instances, that run on the AWS Cloud. Quickly get started by following the simple steps below.
Name and tags Info

Name

| capstone | Add additional tags |

Amazon Machine Image (AMI)

Ubuntu Server 22.04 LTS (HVM), SSD Volume Type   Free tier eligible
ami-0c2af51e265bd5e0e (64-bit (x86)) / ami-0c938b21c7e598cd0 (64-bit (Arm))
Virtualization: hvm   ENA enabled: true   Root device type: ebs

Description

Ubuntu Server 22.04 LTS (HVM),EBS General Purpose (SSD) Volume Type. Support available from Canonical (http://www.ubuntu.com/cloud/services).

Architecture

| 64-bit (x86) ▼ |

AMI ID

ami-0c2af51e265bd5e0e

Verified provider

| ☑ | capstone | i-096b66cba9a20c8b7 | ⊘ Running ⊕ ⊖ | t2.micro | ⏱ Initializing | View alarms ➕ | ap-south-1a | ec2-13-201-48-1 |

Connect that instance

1. Git installation:

sudo apt update

sudo apt install git -y

git –version

2. Docker installation:

sudo apt update

sudo apt install docker.io

sudo docker version

sudo usermod -aG docker ubuntu

sudo systemctl status docker

sudo systemctl start docker

after that, I got some error regarding permission.so I give below commands. search the below commands in ChatGPT

sudo usermod -aG docker ubuntu

newgrp docker

sudo systemctl start docker

sudo systemctl enable docker

just check, docker can pull the image from docker hub. This command not needed for this task

sudo docker run hello-world

sudo apt update

```

Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:
 1. The Docker client contacted the Docker daemon.
 2. The Docker daemon pulled the "hello-world" image from the Docker Hub.
    (amd64)
 3. The Docker daemon created a new container from that image which runs the
    executable that produces the output you are currently reading.
 4. The Docker daemon streamed that output to the Docker client, which sent it
    to your terminal.
```

```
To try something more ambitious, you can run an Ubuntu container with:
 $ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
 https://hub.docker.com/

For more examples and ideas, visit:
 https://docs.docker.com/get-started/

ubuntu@ip-172-31-46-99:~$ docker images
REPOSITORY      TAG       IMAGE ID       CREATED         SIZE
hello-world     latest    d2c94e258dcb   15 months ago   13.3kB
```

docker file:

- In our task given application was already built.
- So, we did not need to write node.js docker file. Just write docker file for nginx server.
- For running the application, we need web server. So, write docker file for nginx web server.
- Because in that server we have to run an already built application.
- **Docker file written in the folder devops-build [in given github this folder available].**
- **so, get into the folder [cd devops-build]**

1. **FROM nginx:latest**:

   o This line specifies the base image to use for the Docker image. In this case, it pulls the latest version of the official Nginx image from Docker Hub.

2. **WORKDIR /usr/share/nginx/html**:

   o This sets the working directory inside the container to /usr/share/nginx/html. This is the default directory where Nginx serves static files (like HTML, CSS, and JavaScript).

3. **COPY build/ .:**

   o This copies the contents of the build/ directory [this dir in the given repo]on your host machine into the current working directory in the container (/usr/share/nginx/html). This typically contains the static files that your web application will serve.

4. **EXPOSE 80**:

   o This line informs Docker that the container will listen on port 80 at runtime. Port 80 is the default HTTP port, so this is where Nginx will serve the web application.

5. **CMD ["nginx", "-g", "daemon off;"]**:

   o This command runs Nginx in the foreground (instead of in the background as a daemon), which is necessary for Docker containers so that the container doesn't exit immediately after starting. The command starts Nginx and keeps it running.

vi dockerfile

FROM nginx:latest

WORKDIR /usr/share/nginx/html

COPY build/ .

EXPOSE 80

CMD ["nginx", "-g", "daemon off;"]

Convert docker file into docker image:

docker build -t nginximage .   [nginximage -we give that image name for our choice]. This command used for build docker image

```
ubuntu@ip-172-31-46-99:~$ vi dockerfile
ubuntu@ip-172-31-46-99:~$ cd devops-build/
ubuntu@ip-172-31-46-99:~/devops-build$ vi dockerfile
ubuntu@ip-172-31-46-99:~/devops-build$ docker build -t nginximage .
DEPRECATED: The legacy builder is deprecated and will be removed in a future release.
         Install the buildx component to build images with BuildKit:
         https://docs.docker.com/go/buildx/

- **build.sh https://github.com/yasminjeelani/newcicd/blob/master/Jenkinsfile**
- **deploy.sh**

<mark>build.sh:</mark>

- The build.sh file is a shell script commonly used in software projects to automate the build process.
- It typically contains a series of commands that compile the source code.
- This script is often used in environments where consistent and repeatable builds are essential, such as in continuous integration (CI) pipelines.

<mark>Build.sh file:</mark>

Home

<> Start writing code

Start a new repository for sharmi2504

A repository contains all of your project's files, revision history, and collaborator discussion.

Repository name *

```
capstone project
```

✓ Your new repository will be created as capstone-p.

The repository name can only contain ASCII letters, digits, and the characters ., - and _.

○ **Public**
   Anyone on the internet can see this repository

○ ~~Private~~
   You choose who can see and commit to this repository

Create a new repository

Give public repo

```
ubuntu@ip-172-31-46-99:~/devops-build$ cd
```

```
ubuntu@ip-172-31-46-99:~$ git clone https://github.com/sharmi2504/capstone-project.git
Cloning into 'capstone-project'...
warning: You appear to have cloned an empty repository.
```

```
ubuntu@ip-172-31-46-99:~$ git clone https://github.com/sharmi2504/capstone-project.git
Cloning into 'capstone-project'...
warning: You appear to have cloned an empty repository.
ubuntu@ip-172-31-46-99:~$ ls
capstone-project  devops-build  dockerfile
ubuntu@ip-172-31-46-99:~$ cd devops-build/
ubuntu@ip-172-31-46-99:~/devops-build$
```

Here capstone-project directory created repo in GitHub . get into that dir . them move that all files from devops-build to capstone-project dir

```
ubuntu@ip-172-31-46-99:~$ cd devops-build/
ubuntu@ip-172-31-46-99:~/devops-build$ ls
build  build.sh  deploy.sh  docker-compose.yaml  dockerfile
ubuntu@ip-172-31-46-99:~/devops-build$ mv * /home/ubuntu/capstone-project
ubuntu@ip-172-31-46-99:~/devops-build$ cd ..
ubuntu@ip-172-31-46-99:~$ cd capstone-project/
ubuntu@ip-172-31-46-99:~/capstone-project$ ls
build  build.sh  deploy.sh  docker-compose.yaml  dockerfile
ubuntu@ip-172-31-46-99:~/capstone-project$
```

```
ubuntu@ip-172-31-46-99:~/capstone-project$ git add .
ubuntu@ip-172-31-46-99:~/capstone-project$ git commit -m "add all files"
[main (root-commit) 13ef6f8] add all files
 Committer: Ubuntu <ubuntu@ip-172-31-46-99.ap-south-1.compute.internal>
Your name and email address were configured automatically based
on your username and hostname. Please check that they are accurate.
You can suppress this message by setting them explicitly. Run the
following command and follow the instructions in your editor to edit
your configuration file:

    git config --global --edit

After doing this, you may fix the identity used for this commit with:

    git commit --amend --reset-author

 19 files changed, 198 insertions(+)

 create mode 100644 build/robots.txt
 create mode 100644 build/static/css/main.cf5c13c5.css
```

All files move in that repo [capstone-project]. then created dev branch. Inside dev branch we add all files.

Create dev branch in git:

```
ubuntu@ip-172-31-46-99:~/capstone-project$ git checkout -b dev
Switched to a new branch 'dev'
```

```
ubuntu@ip-172-31-46-99:~/capstone-project$ ls
build  build.sh  deploy.sh  docker-compose.yaml  dockerfile
```

```
ubuntu@ip-172-31-46-99:~/capstone-project$ git add .
ubuntu@ip-172-31-46-99:~/capstone-project$ git commit -m "add all files"
On branch dev
nothing to commit, working tree clean
```

For password we generate token [that steps given below]

```
ubuntu@ip-172-31-46-99:~/capstone-project$ git push -u origin dev
Username for 'https://github.com': sharmi2504
Password for 'https://sharmi2504@github.com':

New personal access token (classic)

Personal access tokens (classic) function like ordinary OAuth access tokens. They can be used instead of a password for Git over HTTPS, or can be used to authenticate to the API over Basic Authentication.

Note

```
capstone project    I
```

What's this token for?

Expiration *

```
30 days        ⬍
```
The token will expire on Fri, Sep 13 2024

Select scopes

Scopes define the access for personal tokens. Read more about OAuth scopes.

☐ **repo**   Full control of private repositories
   ☐ repo:status   Access commit status
   ☐ repo_deployment   Access deployment status
   ☐ public_repo   Access public repositories
   ☐ repo:invite   Access repository invitations
   ☐ security_events   Read and write security events

Copy and paste the token in password

```
ubuntu@ip-172-31-46-99:~/capstone-project$ git push -u origin dev
Username for 'https://github.com': sharmi2504
Password for 'https://sharmi2504@github.com':

   Main PID: 4951 (java)
      Tasks: 37 (limit: 1120)
     Memory: 284.6M
        CPU: 17.882s
     CGroup: /system.slice/jenkins.service
             └─4951 /usr/bin/java -Djava.awt.headless=true -jar /usr/share/java/jenkins.war
```

Setup Jenkins dashboard:

Add port no:8080 for access the Jenkins browser. Because it is a GUI tool

```
ubuntu@ip-172-31-46-99:~/capstone-project$ vi jenkinsfile
```

Jenkins file:

pipeline {

  agent any

  environment {

    docker_username = credentials('docker-username-id') // Set up your Jenkins credentials

    docker_password = credentials('docker-password-id')

  }

  stages {

    stage('Build') {

      steps {

        // Build Docker image using build script file

        sh './build.sh'

      }

    }

    stage('Login') {

      steps {

        sh 'docker login -u $docker_username -p $docker_password'

      }

    }

```
        stage('Deploy') {

            steps {

                script {

                    if (env.GIT_BRANCH == "origin/dev") {

                        sh './deploy.sh'

                    }

                }

            }

        }

    }

}
```

Add the Jenkins file to giyhub . use the below commands.

```
ubuntu@ip-172-31-46-99:~/capstone-project$ git add jenkinsfile
ubuntu@ip-172-31-46-99:~/capstone-project$ git commit -m "add jenkinsfile"
[dev cbd2aee] add jenkinsfile

Getting Started

Unlock Jenkins

To ensure Jenkins is securely set up by the administrator, a password has been written to the log (**not sure where to find it?**) and this file on the server:

`/var/lib/jenkins/secrets/initialAdminPassword`

Please copy the password from either location and paste it below.

Administrator password

[   ]

Continue

Get above password

sudo cat /var/lib/jenkins/secrets/initialAdminPassword

```
ubuntu@ip-172-31-46-99:~$ sudo cat /var/lib/jenkins/secrets/initialAdminPassword
ef6201f275444ca8a144737522e1fa6d
ubuntu@ip-172-31-46-99:~$
```

ef6201f275444ca8a144737522e1fa6d [copy the password in above]

Unlock Jenkins

To ensure Jenkins is securely set up by the administrator, a password has been written to the log (**not sure where to find it?**) and this file on the server:

`/var/lib/jenkins/secrets/initialAdminPassword`

Please copy the password from either location and paste it below.

Administrator password

`································`
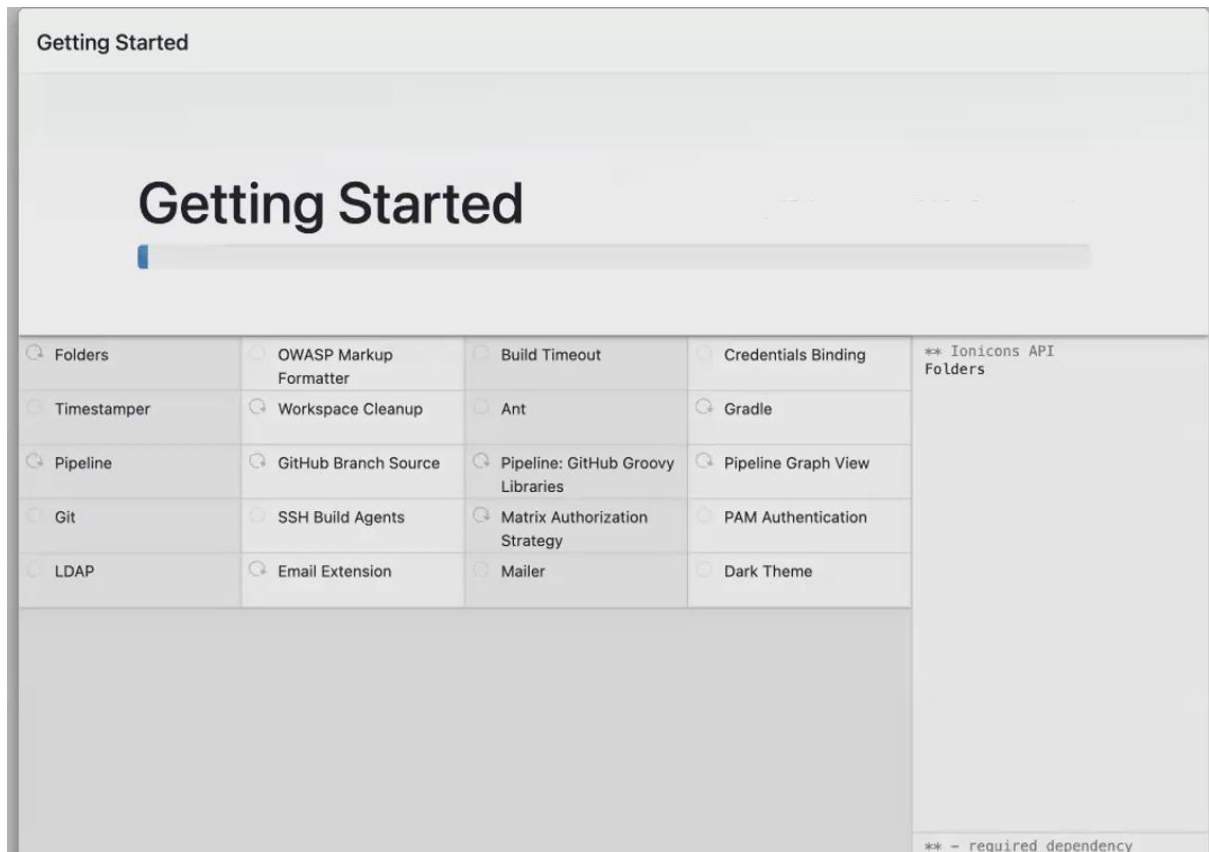

Continue

Customize Jenkins

Plugins extend Jenkins with additional features to support many different needs.

Install suggested plugins

Install plugins the Jenkins community finds most useful.

Select plugins to install

Select and install plugins most suitable for your needs.

Jenkins 2.387.3

Now let's create our first Admin user and provide the required info:

Give username as admin, then only we can access all inside Jenkins. In username don't give your name. In full name you give your name or any other name can be given.

Create First Admin User

Username

admin@jenkins.com

Jenkins 2.387.3

Skip and continue as admin   Save and Continue

Instance Configuration

Jenkins URL:

http://65.2.31.200:8080/

The Jenkins URL is used to provide the root URL for absolute links to various Jenkins resources. That means this value is required for proper operation of many Jenkins features including email notifications, PR status updates, and the BUILD_URL environment variable provided to build steps.

The proposed default value shown is **not saved yet** and is generated from the current request, if possible. The best practice is to set this value to the URL that users are expected to use. This will avoid confusion when sharing or viewing links.

Jenkins 2.462.1

Not now   Save and Finish
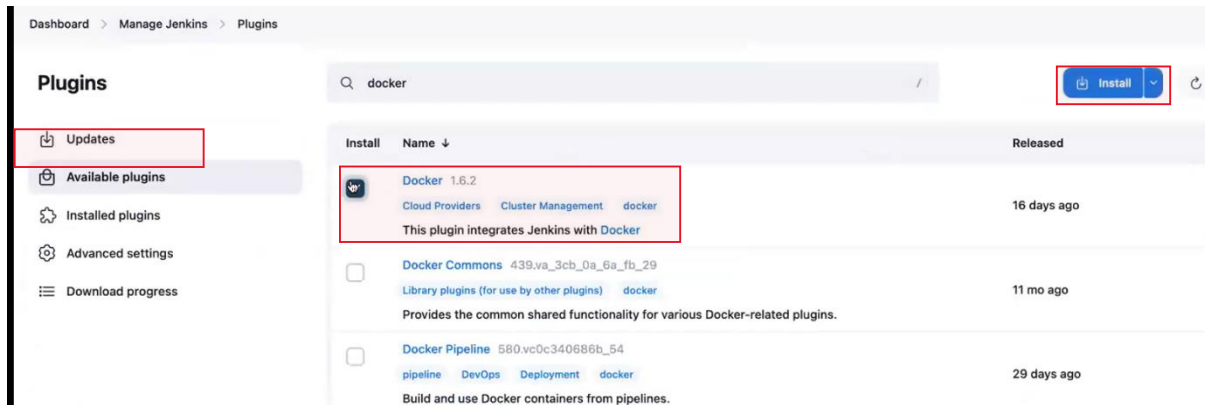

Getting Started

Jenkins is ready!

Your Jenkins setup is complete.

Start using Jenkins

Before creating the job installed docker plugin in Jenkins and install docker in ec2 also.

Q Search settings   /

Building on the built-in node can be a security issue. You should set up distributed builds. See the documentation.   Set up agent   Set up cloud   Dismiss

System Configuration

⚙ **System**
Configure global settings and paths.

🔧 **Tools**
Configure tools, their locations and automatic installers.

🧩 **Plugins**
Add, remove, disable or enable plugins that can extend the functionality of Jenkins.

🖳 **Nodes**
Add, remove, control and monitor the various nodes that Jenkins runs jobs on.

☁ **Clouds**
Add, remove, and configure cloud instances to provision agents on-demand.

🖌 **Appearance**
Configure the look and feel of Jenkins

Security

🔒 **Security**
Secure Jenkins; define who is allowed to access/use the system.

📱 **Credentials**
Configure credentials

🖨 **Credential Providers**
Configure the credential providers and types

Suppose docker already in ec2. then check it is installed or not by using command [docker – version]

Give docker permission for Jenkins. then only we have to build the docker image.

```
ubuntu@ip-172-31-46-99:~$ docker --version
Docker version 24.0.7, build 24.0.7-0ubuntu2~22.04.1
ubuntu@ip-172-31-46-99:~$ sudo usermod -aG docker jenkins
ubuntu@ip-172-31-46-99:~$ sudo systemctl restart jenkins
ubuntu@ip-172-31-46-99:~$
```

After give restart Jenkins, refresh the Jenkins page. again, ask Jenkins login and password.

Add credentials:

we have to pass the credentials for the Doctor Hub. **to push your image to the docker hub registry. You need to do a docker login. So, for docker login. You have to give the username and password. So, your Jenkins have to do the docker login.**

Add credentials

Click dashboard → manage Jenkins

Scope ?

Global (Jenkins, nodes, items, all child items, etc)
Username ?

sharmi2504

☐ Treat username as secret ?

Password ?

Above username is dockerhub user name.For password we generate tokens like github.

Password

****

You can change your password by initiating a reset via email.   Reset password

Security

Two-factor authentication

Two factor authentication is **disabled**.

>

Personal access tokens

There is 1 personal access token associated with your account.

>

Create access token

A personal access token is similar to a password except you can have many tokens and revoke access to each one at any time. Learn more 🔗

Access token description
```
capstone jenkins docker
```

Access permissions
```
Public Repo Read-only                                    ⌄
```

Public Repo Read-only tokens allow to view, search, and pull images from any public repositories.

Cancel   **Generate**

Copy access token

Use this token as a password when you sign in from the Docker CLI client. Learn more 🔗

Make sure you copy your personal access token now. Your personal access token is only displayed once. It isn't stored and can't be retrieved later.

Access token description
capstone jenkins docker

Access permissions
Public Repo Read-only

To use the access token from your Docker CLI client:

1. Run

```
$ docker login -u sharmi2504
```
Copy

2. At the password prompt, enter the personal access token.

```
dckr_pat_tg-HQApdGliv8vy95CdXhtszCbM
```
Copy

Back to access tokens

Copy the token, paste it in Jenkins

capstone

Select an item type

Freestyle project
Classic, general-purpose job type that checks out from up to one SCM, executes build steps serially, followed by post-build steps like archiving artifacts and sending email notifications.

Pipeline
Orchestrates long-running activities that can span multiple build agents. Suitable for building pipelines (formerly known as workflows) and/or organizing complex activities that do not easily fit in free-style job type.

Multi-configuration project
Suitable for projects that need a large number of different configurations, such as testing on multiple environments, platform-specific builds, etc.
